## Chemical Equilibrium

"When a system is in chemical equilibrium, a change in one of the parameters of the equilibrium produces a shift in such a direction that, were no other actors involved in this shift, it would lead to a change of opposite sign in the parameter involved."

Henri Louis Le Châtelier, 1888

### 6.1 The Equilibrium Condition

6.2 The Equilibrium Constant
6.3 Equilibrium Expressions Involving Pressures
6.4, 6.9 The Concept of Activity and Equilibria Involving Real Gases (See Harris 8-2)
6.5 Heterogeneous Equilibria

Please check your grades on Blackboard - Friday is drop date talk with me FIRST!

## The Equilibrium Condition

## The Equilibrium Condition

Our emphasis will be on chemical equilibria but occasionally we will encounter phase equilibria
phase boundaries in a phase diagram; colligative properties examine phase equilibria in mixtures, primarily in liquids
steady state - system with macrosopic concentrations not changing with time but it is not at equilibrium; rather than a dynamic balance between forward and reverse processes a steady state is achieved by competiton between a process that supplies components and another process that removes components; common for chemical reactions in biological systems

## Arrows of Chemistry - Different Equilibrium Constants

reaction
$\mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq}) \rightarrow \mathrm{AgCl}(\mathrm{s})$
resonance
$\mathrm{O}=\mathrm{S}-\mathrm{O} \leftrightarrow \mathrm{O}-\mathrm{S}=\mathrm{O}$
equilibrium

$$
\mathrm{N}_{2} \mathrm{O}_{4}(g) \rightleftharpoons 2 \mathrm{NO}_{2}(g)
$$

## Phase Equilibria

Phase Equilibria

$$
\begin{aligned}
& \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) \rightleftharpoons \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{CO}_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{CO}_{2}(g)
\end{aligned}
$$

Vapor pressure of water as a function of temperature

## The Equilibrium Constant

## Law of Mass Action

For $\mathrm{aA}+\mathrm{bB}<=>\mathrm{cC}+\mathrm{dD}$ the equilibrium constant $K$ is

$$
K=\frac{\mathcal{A}^{\mathrm{c}}{ }_{\mathrm{C}} \mathcal{A}_{\mathrm{D}}^{\mathrm{d}}}{\mathcal{A}^{\mathrm{a}} \mathcal{A}^{\mathrm{b}}{ }_{\mathrm{B}}}
$$

where $\mathcal{A}_{\mathrm{A}}^{\mathrm{a}}$ is the activity (Zumdahl p. 178, 194; Harris p. 164) of species $A$ raised to its stoichiometric coefficient a. Expression for activity depends upon how composition is expressed.

```
molarity \((K), \mathcal{A}_{\mathrm{A}}=\gamma_{\mathrm{A}}[\mathrm{A}] /[\mathrm{ref}] \quad[\mathrm{ref}]=1 \mathrm{M} \quad \mathcal{A}=1\) for pure liquids, solids
pressure \(\left(K_{P}\right), \mathcal{A}_{\mathrm{A}}=\gamma_{\mathrm{A}} P_{\mathrm{A}} / P_{\text {ref }}\)
\(P_{\text {ref }}=1\) atm (bar)
```

Reference composition is usually 1, insures equilibrium constant is unitless; $\gamma$ is the activity coefficient, where deviations from ideal gas or solution found.

[^0]
## The Equilibrium Constant

EX 1. At 1000 K the equilibrium gas mixture contains $0.562 \mathrm{~atm} \mathrm{SO}_{2}, 0.101$ atm $\mathrm{O}_{2}$, and $0.332 \mathrm{~atm} \mathrm{SO}_{3}$. What is $K_{\mathrm{P}}$ ?

$$
\begin{aligned}
& \begin{array}{c}
2 \mathrm{SO}_{2}(g)+\mathrm{O}_{2}(g) \\
0.562
\end{array} \\
\mathrm{EQ} & \rightleftharpoons \begin{array}{c}
2 \mathrm{SO}_{3}(g) \\
0.332
\end{array} \\
K_{\mathrm{P}}=\frac{\mathcal{A}^{2}{ }_{\mathrm{SO} 3}}{\mathcal{A}_{\mathrm{SO} 2}^{2} \mathcal{A}_{\mathrm{O} 2}} & =\frac{\left(P_{\mathrm{SO} 3}\right)^{2}}{\left(P_{\mathrm{SO} 2}\right)^{2} P_{\mathrm{O} 2}} \\
& =(0.332)^{2} /(0.562)^{2}(0.101)=3.46
\end{aligned}
$$

## The Equilibrium Constant $-K$ and $K_{P}$

EX 2. At $250^{\circ} \mathrm{C}$ the equilibrium concentrations are $\left[\mathrm{PCl}_{3}\right]=\left[\mathrm{Cl}_{2}\right]=0.280 \mathrm{M}$ and $\left[\mathrm{PCl}_{5}\right]=1.885 \mathrm{M}$ for

$$
\begin{aligned}
& \mathrm{PCl}_{3}(g)+\mathrm{Cl}_{2}(g) \rightleftharpoons \mathrm{PCl}_{5}(g) \\
& 0.280 \quad 0.280 \quad 1.885 \\
& K=\frac{\left[\mathrm{PCl}_{5}\right]}{\left[\mathrm{PCl}_{3}\right]\left[\mathrm{Cl}_{2}\right]}=(1.885) /(0.280)^{2}=24.0 \quad P V=n R T=P=(n / M) R T=M R T \\
& =\frac{P_{\mathrm{PCl} 5} / R T}{\left(P_{\mathrm{PCl} 3} / R T\right)\left(P_{\mathrm{Cl} 2} / R T\right)}=K_{\mathrm{P}} / R T=24.0 /(0.082)(250+273)=0.056
\end{aligned}
$$

$$
K=K_{\mathrm{P}}(R T)^{\Delta n} \quad \text { where } \Delta n=n_{\text {prod }}-n_{\text {react }}
$$

## Heterogeneous Equilibria

EX 4. What is thc value of $K$ if an equilibrium mixture contains $1.0 \mathrm{~mol} \mathrm{Fe}, \mathrm{I} .0$ $\times 10^{-3} \mathrm{~mol} \mathrm{O}_{2}$, and $2.0 \mathrm{~mol} \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})$ in a $2.0-\mathrm{L}$ container'?

EQ \begin{tabular}{c}
$4 \mathrm{Fe}(\mathrm{s})$ <br>
$1.0 / 2.0$

$+$

$3 \mathrm{O}_{2}(\mathrm{~g})$ <br>
$1.0 \times 10^{-3} / 2.0$
\end{tabular}$\stackrel{2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})}{2.0 / 2.0}$

$K=1 /\left[\mathrm{O}_{2}\right]^{3}=1 /\left(0.50 \times 10^{-3}\right)^{3}$
$=\mathbf{8 . 0 \times 1 0 ^ { \mathbf { 9 } }}$

## Relationship of $K$ 's of Related Equilibria

$$
K_{\mathrm{P}}=55.6 \text { for } \quad \mathrm{H}_{2}(g)+\mathrm{I}_{2}(g) \rightleftharpoons 2 \mathrm{HI}(g)
$$

EX 5. For the above reaction $\left(K_{\mathrm{P}}=P_{\mathrm{HI}}^{2} / P_{\mathrm{H} 2} P_{\mathrm{I} 2}\right)$ what is $K_{\mathrm{P}}$ for:
a) $2 \mathrm{H}_{2}(g)+2 \mathrm{I}_{2}(g) \rightleftharpoons 4 \mathrm{HI}(g)$
multiply all coefficients by $n=>K_{\text {new }}=K_{o}{ }^{n}$
b) $2 \mathrm{HI}(g) \rightleftharpoons \mathrm{H}_{2}(g)+\mathrm{I}_{2}(g)$
reverse reaction (multiply by -1) $\Rightarrow>K_{\text {new }}=K_{0}{ }^{-1}=1 / K_{0}$
c) $1 / 2 \mathrm{H}_{2}(g)+1 / 2 \mathrm{I}_{2}(g) \rightleftharpoons \mathrm{HI}(g)$
multiply all coefficients by $n=1 / 2 \Rightarrow K_{\text {new }}=K_{0}^{1 / 2}=\sqrt{ } K_{0}$

[^0]:    $\gamma=1$ ideal gas, ideal solution (obeys Raoult's law)
